

# Data Analysis 4/5/18

\* BUT! ~~1309~~ doesn't split evenly so you need to truncate the size to a decimal # like ~~3275~~ 654.5 instead we use 654 for train and 655 for test.

Here we're replacing the null values we originally set

(L90) 

70%	30%
train	test

$mod3 = pclass + \#sib + \#parch + embarked$

Is this a better model? Why/why not?
